

## WinProxy

How do you get everyone online through a single Internet connection, keep them from viewing inappropriate material and make your network secure on a limited budget?

### Overview

WinProxy provides everything you need to simultaneously connect all your computers to the Internet through just one simple connection with your existing service provider. Plus, it includes innovative features like a built-in firewall, centralized anti-virus protection, custom alerting, website filtering and user privileges to put you in complete control of Internet access.

### Simultaneous and Transparent Access

With WinProxy there's no special software to install on each computer, and no need to configure individual applications. Simply open your browser or other Internet application and you're automatically connected to the Internet. And, it works with all your favorite applications including e-mail, chat, NetMeeting — even online games.

### Secure Firewall and Antivirus Protection

WinProxy protects your entire network against Internet intruders and Net borne viruses. Choose from pre-defined Firewall security settings or customize your own. Its built-in anti-virus protection (2) guards against malicious code in e-mail attachments and Internet downloads, allowing you to stop infected files from entering your network.

### Outgoing and SMTP Virus Scanning

Incoming and outgoing email messages are scanned at the server level for viruses. Never send out an infected file again! SMTP virus scanning has been added to the server level antivirus protection protocols which also includes support for FTP, HTTP and POP3 email.

### Support for VPN client

Added support for Microsoft, Nortel and Cisco VPN client access

### Extensive Alerting for Events

New alerting for events includes advanced user modifiable notification for virus attempts, smart filter, whitelist and blacklist violations. Alert rule creation can be managed easily at both the global categories level all the way down to specific protocol level functions. The notification method can be selected independently for each rule including email, popup message, program message or special log creation. The alert message may also be customized per rule.

### Robust User Restrictions and Internet Access Control

With WinProxy, you're in control over who gets on the Net. Each user or user group can be individually controlled by time, site filters, protocol, or activity by specific activities such as browsing, chat or e-mail. Define access to the Internet by both user groups and individual access controls. Take control of your Net!

### Transparent Proxy Technology

WinProxy combines the simplicity of Network Address Translation with the flexibility and control of a proxy server. This eliminates the need to reconfigure applications or install special software on each client computer while preserving the ability to control and actually enhance Internet access for your entire network. And, built-in DNS and DHCP servers eliminate network configuration making installation a breeze for even a novice.

### Faster page loading

WinProxy's new transparent proxy technology gets you up and running in minutes by eliminating the complexity of traditional Internet sharing schemes. Simply install WinProxy on just one of your network's PCs. Its intelligent Install Wizard does away with network jargon and automatically verifies your Internet connection settings.

# Proxy Server

## Additional WinProxy Features

- Saves money by eliminating multiple phone lines, modems, and user accounts
- Works with any ISP including AOL (1)
- Windows 95/98/NT/2000/Me/XP compatible
- Works with cable modems, DSL, analog modems, satellite, ISDN, Frame Relay, T1-T3, wireless
- Supports virtually any PC network including Windows 95/98/NT/2000/Me/XP built-in networking and phonenumber networks
- Does not require a dedicated server
- Automatically runs in background
- Supports Mac and Unix/Linux clients
- Internet gaming - supports most online games
- Supports all popular e-Mail clients including Eudora and Outlook and multiple mail servers
- Banner Blocker stops unwanted ads from loading
- Automatically connects and disconnects from Internet as required
- View all active Internet connections in real time
- Maintains a historical log of all connections
- Supports e-mail and Web servers located behind the Firewall
- Proxy cascading and mapped port support

## System Requirements

### Minimum System Requirements

- Pentium II PC or higher
- Any Microsoft operating system
- 128 MB RAM
- 20 MB for application data
- 5 MB for Anti-virus
- 10 MB for caching
- 50 MB for Site filtering
- 1 LAN connection
- 1 Internet connection
- 1 ISP user account

### Minimum Network Requirements

All computers must be networked with TCP/IP protocol installed.

#### Client Computer(s)

Any PC, Mac or UNIX/Linux based system

### Networks Supported

Any ethernet LAN, including Windows 95/98/NT/2000/Me/XP built-in networking

### Protocol Support

HTTP, SSL, FTP, DNS, SOCKS 4 & 5, Real Audio/Video, NNTP (News), Telnet, AOL, POP3, SMTP, IMAP4, UDP, Mapped ports, outgoing Microsoft VPN

### Internet Connection Types

Any TCP/IP connection, including: Modem, Cable Modem, Satellite, xDSL, ISDN, T1-T3, E1-E3, Frame Relay, Wireless

1. Multiple users may simultaneously access the Internet through a single AOL account. Requires a separate AOL account for each user wishing to access AOL's proprietary OnLine Channels at the same time.
2. Includes free 6 months of anti-virus pattern file updates after the 6 month period you will need to purchase an antivirus subscription.
3. Includes free 6 months of Secure Computing's SmartFilter; Basic site filtering updates after the 6 month period you will need to purchase a site filtering subscription.
